10 References and further information .................................................................................................... 36
Quad bikes (four-wheeled motorbikes) are popular and useful machines that help Australian farmers tend to crops and livestock quickly and efficiently. However, quad bikes are also a significant cause of death and injury on Victorian farms.

Approximately 10 people die in quad bike incidents on Australian farms every year and many more are injured. The emotional and financial cost of these deaths and injuries to farm families and communities is immense.

This handbook has been developed by WorkSafe Victoria to encourage the safe use of quad bikes. It outlines legal requirements and strategies to ensure the safe operation of quad bikes on farms.

Led by Ballarat University's Victorian Farm Safety Centre, a reference group of industry experts was convened to support the development of this handbook.

WorkSafe encourages all farmers and contractors (whether employers or sole operators) and all farm workers to read this handbook and make quad bike accidents a thing of the past.

**Important information - Quad bikes are not all-terrain vehicles or ATVs**

In April 2009, the Victorian coroner in an inquest into eight fatalities involving quad bikes observed that: ‘To describe a quad bike as an all-terrain vehicle is a serious overstatement of its capabilities.’

He went on to comment: ‘Quad bikes are described, marketed and sold as all-terrain vehicles. They do not possess all-terrain capability. The description of a quad bike as an all-terrain vehicle creates an impression of invincibility. Manuals replete with warnings setting out the limitations of quad bikes have failed to negate the fallacy.

‘Despite warnings to the contrary, there exists the false perception that quad bikes are stable, robust machines with ‘go-anywhere’ capability. **Quad bikes are not all-terrain vehicles.**’

In accordance with the coroners’ findings, WorkSafe Victoria has determined it is appropriate to change its publications accordingly. This handbook replaces *All-terrain vehicles on farms*.

WorkSafe calls on the quad bike industry to change the way it describes and promotes quad bikes to help prevent injuries or fatalities from these vehicles.

This handbook is not a substitute for the operator’s manual for your specific quad bike. It should be read in conjunction with your operator’s manual because quad bikes can be dangerous when used outside the manufacturer’s guidelines.
Who should read this handbook?
This handbook is for farmers, their family members, employees and contractors. While this handbook focuses on quad bike use on farms it will be useful to all who operate or manage those who operate quad bikes.

Why should you read this handbook?
The handbook will help users of quad bikes to identify hazards associated with their use and provides a range of simple solutions that may reduce the potential of both accident and/or injury.

What information does this handbook contain?
It explains the obligations employers and employees have under the Victorian Occupational Health and Safety Act 2004 (OHS Act). It also has information about risk factors, choosing the right vehicle for the job, safe operation and maintenance.

This handbook includes a number of checklists to assist farmers and farm managers to identify and control risks associated with the use of quad bikes. Checklists may be altered to suit a particular property. The checklists are also available on-line at worksafe.vic.gov.au

Don’t just read the handbook—Act on it
Quad bike operators need to understand the risks associated with the use of quad bikes so they can make informed choices that minimise risks and lead to safe use.

Case study
You are never too old or too experienced to wear a helmet
A 71-year-old farmer was killed when she was thrown from her quad bike into a barbed wire fence and hit her head on a rock. She had been checking stock and water. She was found by her son in an area that was deeply rutted, approximately 15 metres from the quad bike which was entangled in the fence. No helmet was worn.

Case study
Even the simplest job can be risky
A farmhand was killed traversing a slope along a makeshift road with long grass and a steep, uneven gradient. He had tied steel to the back of his quad bike which toppled over and landed on top of him as he was traversing the slope. He was 59 years old.
1. What is a quad bike?

For the purpose of this publication a quad bike is defined as:

*Any motorised off-highway vehicle designed to travel on four low pressure tyres, having a seat designed to be straddled by the operator and handlebars for steering control, and intended use by a single operator and no passenger."

Quad bikes can be two-wheel drive or four-wheel drive and are sometimes referred to as 'four-wheel motorbikes'. They are only one of many vehicles that are useful for work on farms.

This handbook refers only to single-operator quad bikes as described in the definition above.

In many respects the quad bike is the modern equivalent of a horse. It carries a person and is reasonably manoeuvrable. Like a horse, a quad bike can pull implements and trailers, assist in mustering and help farmers check stock and fences. For many farmers, quad bikes are indispensable equipment and used almost every day.

But quad bikes have no innate sense of balance, they cannot compensate for poor skills or inexperience, they won't come when called and will never be able to take a severely injured operator home or raise the alarm.

Case study

Help needed

A farmer was riding a quad bike on his property when it rolled over on an embankment. The man walked approximately 40 metres and then collapsed and died. His body was not located until the following day.
2. Risk factors

Farmers must make informed choices about the safest and most appropriate vehicles for particular tasks on their farms. Knowledge of the source of risks relating to death and injury, plus an understanding of how to avoid or minimise risk can help you with the decision-making process.

2.1 Quad bike use

Studies of quad bike use show:

- Riders of all ages are at risk of death. The age range of those who have died broadly reflects the age distribution of farmers.
- The majority of those who have died were quad bike operators, however passengers and bystanders are also at risk.
- The majority of fatal quad bike incidents involve males, but females are also at risk.
- Quad bike-related deaths are associated with a wide range of work activities in agriculture and horticulture.
- A significant number of on-farm deaths are associated with recreational activities on farms.
- There is a propensity for quad bikes to roll over and cause serious injury or death to operators.
- Incorrect loading of the quad bike has been associated with rollover deaths. Terrain, slope and surface appear to play key roles in quad bike-related deaths.
- The head and chest are the most common body parts injured. Most of these injuries are caused by crushing between the quad bike and the ground or other surface, while others occur when operators are flung onto hard surfaces in a crash.
- Most injuries and deaths involve the head and cervical spine, crush injuries and asphyxia.¹

Farmers have been killed while:

- controlling weeds
- mustering/herding/drafting stock
- inspecting property/water/stock
- moving materials
- travelling
- hunting.

¹ Source: Fragar, L. & Pollock, K. 2007, All-terrain Vehicle (Quad bike) Safety on Australian Farms Briefing Paper, prepared for the Farmsafe Australia Reference Group on Quad bike Safety
2.2 Rollover

Vehicle rollover is a common event in quad bike incidents. Quad bikes can roll over in any direction — to the front, side or rear. Rollover can occur suddenly, even at low speeds, putting the operator at risk of injury or death from being thrown from the vehicle, trapped, and/or crushed beneath it. The risk of rollover is increased if the quad bike:

- is traversing slopes
- is travelling at high speed
- is towing an implement
- is carrying a heavy or unstable load (like chemicals for spraying)
- has tyres that are under inflated or unevenly inflated.

**Case study**

**Exercise caution when spraying**

A 75-year-old man was killed while operating a quad bike equipped with a 50-litre spray tank full of chemical spray. He was working in a wet area on an incline of 20–30 degrees. The man's wife discovered him lying face down towards the rear of the quad bike which was on its side on top of the man.
The table below highlights conditions to be considered to ensure the safe operation of your quad bike. If any of the conditions exist you will need to take steps to control the risk.

### Controlling the risk

| **Equipment and attachments** | • Loading  
| | – overloading  
| | – liquid loads  
| | – unstable or unbalanced loads  
| | – over-sized trailers  
| | • Poor maintenance of both mechanical and safety items  
| | • Incorrect tyres for conditions  
| | • Incorrect tyre pressure  
| | • Inadequate guards to protect hands and feet |
| **Operator characteristics** | • Age of operator  
| | • Physical fitness of operator  
| | • Operator competency  
| | – type of activity to undertake eg mustering or spraying while operating a quad bike |
| **Operator behaviours** | • Failure to observe manufacturer's safety warnings or recommendations for use of vehicle  
| | • Failure to wear adequate personal protective equipment (PPE) such as helmets or hearing protection  
| | • Speeding  
| | • Single seat quad bikes used to carry passengers |
| **Environment** | • Bright sunlight that can affect the vision of the operator  
| | • Fences that are hard to see  
| | • Obstacles – overhead, ground level or hidden in long grass (eg stumps and animal burrows)  
| | • Terrain variations  
| | – mud  
| | – sand  
| | – uneven surface  
| | – frost, snow and floods  
| | • Unpredictable surface changes  
| | • Pavement or bitumen surfaces  
| | • Chemical exposure  
| | • Other vehicles |
3. Legal requirements

3.1 Health and safety

The OHS Act applies to all workplaces, including farms. As a farmer, you may be an employer, a self-employed person, a manager, or a person in control of the farm and as such, you have legal responsibilities under the OHS Act.

These include ensuring that:

- the farm is a safe working environment without risk to the health of your employees
- all people (including family members, employees, visitors, contractors) are not exposed to risks to their health and safety arising from farm activities
- the means of entering and leaving the farm are safe and without risk to health.

If you are an employer, you should:

- consult with your employees and any health and safety representatives (HSRs) on matters that might affect their health and safety
- report serious incidents to WorkSafe Victoria.

The reporting duty also applies if you are self-employed.

The Occupational Health and Safety Regulations 2007 have more detailed requirements for the identification and control of hazards associated with the use of plant such as quad bikes.

If your employees use quad bikes, you must:

- identify any hazards associated with the quad bikes and their use, and ensure that any risks are eliminated or reduced
- provide and maintain quad bikes that are safe
- provide and maintain safe work practices relating to quad bike operation, and
- provide employees with sufficient training and supervision so that they can work safely with quad bikes.

Employees must:

- take reasonable care for their own and others’ health and safety
- cooperate with their employer in any actions taken to comply with the OHS Act and Regulations.
3. Legal requirements

3.2 Registration and licensing

3.2.1 Registration in Victoria

VicRoads administers the registration and licensing of quad bikes.

In general:

- Off-road requirements – quad bikes used strictly on private property do not need to be registered and their operators do not have to hold a valid driver’s licence.
- On-road requirements – quad bikes used on-road, even for short periods, must be registered and on-road operators must hold a valid car licence (ie Learner’s Permits are not sufficient.)

Primary producers may apply to VicRoads to register a quad bike as a Primary Producer Special Vehicle. VicRoads regulations state that Primary Producer Special Vehicles can be registered to a primary producer who only uses the vehicle:

- in connection with his business as a primary producer, or
- for travel between his premises and the premises of another primary producer to carry out business. The other business must be within a radius of 25 kilometres from the residence of the vehicle’s operator so the vehicle can be used on the land of that primary producer.

Operators can only drive quad bikes on roads if:

- The quad bike is registered by VicRoads (Primary Producer Special Vehicle category) and covered by the Transport Accident Commission (TAC) cover
- The vehicle does not travel on the paved (sealed and unsealed) surface of the highway except:
  - where it is unavoidable,
  - for the purpose of crossing a railway line, bridge, ford or causeway, or
  - for the purpose of crossing the highway by the shortest convenient route.
- The driver wears an approved motorcycle helmet
- No passengers are carried
- The vehicle does not travel on a highway which is in a built-up area
- The vehicle does not tow a trailer or other vehicle with a laden mass that exceeds 250kgs.

For more information about quad bike registration contact VicRoads.

3.2.2 Registration in Queensland

The Department of Transport and Mains Roads (TMR) can be contacted for information about driver licensing and vehicle regulations in Queensland.
4. Vehicle selection

The safest vehicle is the one best suited to the job
Quad bikes are practical for many tasks, however they have limitations. Small on-road vehicles, two-wheel motorbikes and light utility vehicles may be a better choice for many jobs on farms.

4.1 Is a quad bike the best option for your farm?
When purchasing a vehicle, a bit of research goes a long way toward helping you get the vehicle that's best for you. There are three easy steps to help you select the right vehicle for your farm.

1. Identify your needs and relevant operator safety issues.
2. Compare vehicle options to your needs.
3. Question dealers and others with relevant knowledge.
4. Vehicle selection

4.1.1 Identify your needs and relevant operator safety issues

Before you visit dealer showrooms, make a list of your needs. Some questions to ask include:

- **Tasks** – What tasks will it be used for? What do you need it to do?
- **Conditions** – What are the most common conditions you will be using it in? Rocky or hilly country? Mud? Sand?
- **Safety** – Which vehicle provides the operator with the greatest level of safety for each task?
- **Operator** – Who will be operating the vehicle? What training do they have, or require? What size and age are they? Do I have the necessary skills and expertise to train the operator(s) or would I need to seek outside trainers?
- **Protective equipment** – What protective gear is required?
- **Potential road use** – Will there be times when the vehicle is operating on the road?
- **Loads** – What will be carried and how much will it weigh?
- **Towing** – Will the vehicle be used to tow trailers or other attachments? If it will, what will be the maximum weight and height the vehicle will be required to tow?

4.1.2 Compare vehicle options to your needs

Quad bikes have a light footprint and are an economical single person vehicle for off-road use. However, a quad bike may not be the most suitable choice when farm work requires more power.

Larger and more powerful quad bikes have become available in recent years. A key safety consideration on larger quad bikes, especially for inexperienced operators, is the aggressiveness of the throttle action when starting off and changing gears while on the move. Therefore larger quad bikes may not be as safe as smaller ones for many tasks, for example, droving.
## Vehicle selection

The information in this table may assist you in selecting the safest vehicle for jobs on your farm.

### Farm vehicle selection options

<table>
<thead>

Adapted from Farmsafe Australia Inc, Safe operation of All-terrain Vehicles and All-terrain Utilities on Australian Farms – An Industry Strategy 2004–2009
4.2 Quad bike selection criteria

If you have decided that a quad bike is best for your operation, there are still many options and combinations to consider:

- size range from small and lightweight, to large and heavy
- high or low engine capacity size (cc)
- two-wheel drive and/or four-wheel drive
- front and/or rear brakes - some may have linked hand and/or foot brakes
- electric start, kick-start and/or pull-start
- liquid-cooled and/or air-cooled engines
- automatic or hand-operated clutches
- ability to drive in reverse or reverse gear provided
- solid drive axles, differentials
- chain drives, shaft drives
- thumb lever throttles, twisting handgrip throttles
- controls and their locations differ from one quad bike to another.

4.2.1 Loads and attachments

It is also important to consider the load specifications of particular quad bikes and what attachments are available. The manufacturer's specified load limit includes the operator, the load being carried, plus any attachment used. These should be factored into the total weight of any load and will impact upon the safe choice you make about a particular quad bike.

Ask suppliers about the suitability of their range of quad bikes and attachments for the tasks you want to do on your farm. In the final analysis, safety must be the paramount consideration.
As stated in section 3, farm operators are responsible for ensuring, so far as is reasonably practicable, that the area they control or manage is safe and without risks to health. Farm safety systems help you meet your legal OHS requirements, and are specific to your farm environment. Some key safety systems include:

- farm quad bike operating rules
- emergency communication systems, and
- training and supervision.

5.1 Farm quad bike operating rules

Farm quad bike operating rules are the basic rules for operating quad bikes on the property. When developing these rules, be guided by the manufacturer’s specifications and the safety warnings on the vehicle. At a minimum, farm quad bike operating rules should cover:

- information about the make and models of quad bikes on your farm
- who is authorised to operate each quad bike
- what training and induction is required
- information that passengers are not to be carried on quad bikes
- what protective gear must be worn, how to care for it and how to store it
- what each quad bike can be used for, and what it can’t be used for
- where it can be ridden. Are parts of the farm quad bike no-go zones? Are there designated tracks?
- what conditions each quad bike can be used in, and what conditions it cannot be used
- what speed the quad bike is to be ridden on tracks, paddocks and around buildings
- how to safely load and unload each quad bike and how much it can carry
- how the quad bike will be loaded for transport
- how the quad bike will be stored
- what attachments are to be used with the quad bike
- when and how the quad bike is to be maintained or defects rectified
- what communication systems are to be used by quad bike operators on your farm.
5.2 Communication systems

In many quad bike-related fatalities, the victim was not noticed as missing for at least 24 hours, sometimes considerably longer. Some of these lives could have been saved if the victim communicated they were injured and received help promptly.

As farm employees often work alone, it is important someone else knows their planned movements. If they are late returning, a phone or two-way radio call will keep concerned parties informed. If there is no answer, the other person can arrange for someone to search for the person.

Developing a communication plan is a good safety strategy. Once established, it will soon become automatic.

5.2.1 Sample communication protocol

If you will be working alone and out and about on a quad bike:

- Identify someone on the farm or close by who agrees to check for your planned return and monitor a phone and/or two-way radio while you are working.
- Leave a note for the person advising them:
  - what you will be doing
  - where you will be
  - when you expect to return.
- Discuss emergency plans with the person:
  - if you are late, how much leeway until the alarm is raised?
  - will they come looking or call emergency services first?
- Wear a high visibility vest and/or put a high flag on the quad bike to improve your visibility.
- Carry adequately powered and charged two-way radio and/or mobile phone.

5.2.2 Some ways to raise help are:

- In an emergency call 000 from fixed or mobile phones. Call 112 from GSM mobile phones only – when dialling ‘112’ on GSM mobile phones, access is provided regardless of the presence or validity of a SIM card within the phone or whether the keypad is locked. A signal is still necessary. The call automatically directs to 000.
- Two-way radio, either UHF or CB - UHF channel 5 is established by law for use by anyone, but only in an emergency situation.

Case study

Could communication have helped?

A middle-aged farmer's wife was concerned when her husband didn't arrive home for lunch as arranged. He had taken his quad bike to check the property. Later that day he was found pinned under the rear section of his quad bike, part way down a steep section of an isolated paddock. He was deceased.
5.3 Training and supervision

No operator should use a quad bike for farm work without first receiving training. Training is essential to help reduce the risk of serious injury and death associated with quad bike use. Training and supervision ensure the farm safety systems are communicated to employees and that employees follow the systems.

The manufacturer, supplier, an external training provider or yourself (if you have the necessary skills and expertise), can provide training. Some suppliers provide training options at the time of purchase.

5.3.1 Training requirements

- Induction
  
  Farm managers must ensure new employees are trained before they use equipment. The induction should outline the farm operating rules and familiarise the worker with the safety instructions in the operator's manual as well as the location of the operator's manual. Any quad bike no-go zones on the farm should also be explained.

- Upgrading and training for existing employees
  
  Farm managers must ensure experienced operators and long-term employees receive training when there is a change in vehicle or attachments.

5.3.2 Supervision

Supervision ensures employees operate quad bikes safely. Supervision may need to be more frequent at first to support new and young workers or other workers who are not familiar with quad bikes.

After providing training or an induction, it is advisable to carry out (and document) a practical skills assessment of each person who is to operate existing and/or new quad bikes on your farm. The purpose of this is to help you gauge the skills of employees before they operate a quad bike on your farm. This skills assessment involves the operator demonstrating knowledge about the quad bike, its operation, your farm rules and showing you their riding skills.

5.3.3 Maintaining records of training and supervision

Keep records of training and induction that is undertaken, noting the names of the trainer and the operator, the date, location of training and the skills assessment results of training. Also, when problems are reported, record the problem as well as the actions undertaken to remedy it.

The following 'Sample quad bike operator skills assessment' checklist can be adapted for use on your farm.
### 5. Farm safety systems

**Sample quad bike operator skills assessment**

Add to or alter this form to suit your quad bike and farm rules.

- Maintain completed forms to provide a record of completed inspection and/or training.
- The operator’s manual provides information about minimum maintenance activity.
- Additional copies of checklists are available at worksafe.vic.gov.au

Name of operator: 

Date of assessment

Person conducting assessment: 

For quad bike No.

Adapted from Farmsafe Australia Inc, 2006, Safety of All-terrain Vehicles (Quad bikes) and other small Utility Vehicles on Australian Farms, A practical management handbook, Australian Centre for Agricultural Health and Safety.
6. Using a quad bike

For many farmers it is second nature to use a quad bike, but many injuries and fatalities happen on farms from using quad bikes inappropriately. When you own a quad bike, it can become a habit to use the quad bike, but quad bikes are not suited to all operators, conditions or tasks.

The following sections include useful advice for operating your quad bike safely.

6.1 Operators

The operator must be able to safely operate the quad bike. Some aspects to consider when matching a quad bike to an operator include:

- **Size of operator**: Large or heavy framed people require a larger vehicle, smaller people require a smaller vehicle – match the quad bike to the size of the person.
- **Operator competence**: Some quad bikes are more difficult to operate than others based on their speed, agility and other performance characteristics. Ensure the operator has the skill and experience to operate the quad bike safely.
- **Operator age**: Use of adult-sized quad bikes by persons under the age of 16 is not recommended by manufacturers.
6.2 Conditions and tasks
The conditions on your farm and the tasks that will be done are also key considerations when thinking about using a quad bike. When riding in sand and mud, specific riding skills are required, particularly in maintaining vehicle momentum and stability. Other factors that can affect quad bike operation are seasonal conditions like frost, snow or flooding. Attachments, liquid loads and multi-tasking are risks that can be managed. Some techniques for managing these risks are outlined below.

6.3 Challenging terrain
Operators must take precautions while riding on challenging terrain.

**Recommended precautions**

- Ride on familiar tracks and be aware of what obstacles are in your path (like drains or rough surfaces).
- Assess the terrain before you choose to ride over it. If you are not confident about riding over a particular patch of terrain, go another way or turnaround and use a more appropriate vehicle to complete your task.
- Watch the ground ahead for potential hazards such as tree stumps, rabbit burrows, rocks or branches, especially in long grass.
- Terrain can change in wet weather and require different skills and greater vigilance to operate a quad bike.
- Quad bikes may become unstable where the terrain is rocky, rough or steep because the centre of gravity can shift quickly and dramatically in these conditions.
- Be aware that liquid loads can cause sudden shifts to your quad bikes centre of gravity when riding over uneven terrain.
- Remember that steep slopes put you at risk of rollover. The steeper the slope the higher the risk of rollover.
- Keep speed down on slopes and in long grass.
- Select low ratio gear when going up or coming down a slope. This also allows for engine braking to control speed when coming down hills.
- It is safer to ride up or down slopes rather than across them.
- When operating on slopes, operators must be trained in active riding techniques so that they know when to change their riding position to safely cross slopes and make turns.
6. Using a quad bike

Case study

Choose your riding path carefully
A young man, who owned his quad bike for two weeks, was carrying a passenger when his vehicle hit a low-lying outcrop of rock. Both the rider and passenger were thrown off the vehicle and the rider died from multiple injuries.

6.4 Attachments, loads and towing
Carrying loads on the front and/or rear racks of quad bikes is convenient, but can be risky because the extra weight can affect braking, alter the centre of gravity and make the vehicle difficult to control.

Manufacturers specify load and towing limits in the operator's manual and on the quad bike itself. These limits should not be exceeded. Manufacturer’s load and towing limitations include:

- weight of the load
- location of the load
- attachment weight
- operator weight.

If an after-market attachment is used, the combined total weight should not exceed the manufacturer's weight or towing specifications.

Some farms may use more than one type of quad bike and the weight specifications may be different for each of them. Where necessary, check with your supplier.

Never operate an overloaded quad bike.
Never overload trailers.

Case study

Be cautious when spraying
A farmer was spraying using a quad bike fitted with a spray tank. The terrain was very steep and uneven. When he did not return by nightfall, a search was undertaken and he was found with the quad bike on its side, across his head and chest. He could not be revived.
### Tips for loads and towing with your quad bike

<table>
<thead>
<tr>
<th>Tip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decide if there is a better alternative than your quad bike for towing.</td>
</tr>
<tr>
<td>Always obey the manufacturer's load limitations and recommendations. The brakes on a quad bike are designed to operate effectively within the limits specified, over relatively smooth and level terrain.</td>
</tr>
<tr>
<td>Keep the load low. High loads raise the centre of gravity and should be avoided.</td>
</tr>
<tr>
<td>Reduce speed and allow longer braking distance when carrying a load. Use low gear. The more weight you carry, the slower you should go.</td>
</tr>
<tr>
<td>Avoid hills and rough terrain. The weight of cargo carried should be reduced in rough terrain or as the slope increases. If operating on steep slopes, little or no load should be carried. Speed of operation should also be modified.</td>
</tr>
<tr>
<td>Secure loads to racks with straps provided.</td>
</tr>
<tr>
<td>Connect to the towing point of the vehicle only.</td>
</tr>
<tr>
<td>Operate only with stable and safe loads.</td>
</tr>
<tr>
<td>Do not travel faster than the speed recommended in the operator's manual or in your farm rules.</td>
</tr>
<tr>
<td>Tanks for liquids should have baffles to reduce the movement of the liquid.</td>
</tr>
</tbody>
</table>
6. Using a quad bike

6.4.1 Liquid loads and tanks

Liquid loads, either carried on the quad bike or towed, are unstable because the contents can shift when cornering or traversing slopes. This decreases quad bike stability and increases the likelihood of rollover. Tanks fitted with baffles are a better option, but they do not completely reduce the risks associated with liquid loads.

When carrying liquid loads, include the weight of the contents of the tank in your load calculations. One litre of water weighs 1kg.

At a minimum, tanks for liquids should:

- have internal baffles that restrict the movement of liquid as the tank is moved
- have smooth external surfaces with no sharp edges and be as low as possible to keep the centre of gravity low
- allow the operator to move freely when operating the quad bike without obscuring their vision or interfering with operator controls
- not touch the operator or restrict their ability to separate from the machine in the event of a rollover
- be properly sealed to avoid splashing of chemicals onto the machine, the operator or surroundings
- must not exceed the manufacturer's load limits for each quad bike.

6.5 Multi-tasking

Where a quad bike operator undertakes a task (such as spraying or mustering) while operating a quad bike, their skill level needs to be higher than that required for simple riding. Multi-tasking increases risk because the operator may focus on the task rather than operating the vehicle.

Mustering provides a good example of this. Quad bike operators focus on the livestock rather than the ground they are riding over and may not be aware of unexpected surface changes or obstacles.

To increase your safety when mustering or performing other multi-tasking activities, maintain slow speed and seek a path over the terrain that provides the best visibility of any potential obstruction or hazard.

Case study

Mustering without a helmet

A 38-year-old man was killed when mustering cattle on a quad bike. While pursuing an animal in the area adjacent to the road he came off the quad bike and landed awkwardly approximately two metres from the quad bike. He was not wearing a helmet.
6.6 Wear the right PPE for the task
Quad bike operators should wear appropriate personal protective equipment (PPE) when operating a quad bike.

**Case study**

**A young man without a helmet**
A 21-year-old man was killed while accelerating up a steep embankment. The front wheels of his quad bike left the ground, causing it to roll over onto him. He was not wearing a helmet.

**PPE Information**

| **Helmet** | - A helmet is the most important piece of protective equipment and should be worn at all times the vehicle is being ridden.  
  - Select a helmet that complies with Australian Standard 1698:2006 *Protective helmets for vehicle users*. These helmets meet the requirements for on-road and off-road use.  
  - Ensure the helmet fits the operator snugly, is securely fastened and provides good, all-round visibility. A poorly-fitting or loose helmet can become dislodged in an incident and then offer no protection at all.  
  - Operators should not share helmets but instead use personal helmets for size and hygiene reasons. |
| **Eye protection** | - Eye protection is recommended to prevent eye injuries and prevent branches, bugs, dust or sand hitting your face and distracting you. Sunglasses are unlikely to provide adequate physical protection. Suitable types of eye protection include:  
  - helmets fitted with visors (check visibility of tinted visors in low light conditions), or  
  - a pair of riding goggles. If goggles are worn, ensure they are good safety goggles, are well-ventilated, and able to be securely fastened. |
| **Gloves** | - Gloves are recommended to provide protection from abrasions and help to keep your hands from getting sore, tired or cold. Note that rigger’s gloves may become slippery when wet and are not advisable for use with quad bikes. |
| **Footwear** | - Sturdy footwear is recommended (preferably boots that come up past your ankle with strong uppers for gear changes.)  
  - Heels will prevent your feet from slipping off the foot decks. |
PPE Information (cont.)

| Clothing | • Arms and legs should be covered to reduce abrasions to the body, even in hot weather.  
|          |   • Trousers should be close-fitting and in good condition. |
| Hearing protection | • If the vehicle operation is rated above 85 decibels, hearing protection such as earplugs should be used. |
| UV protection | • UV protection is recommended as helmets may not protect your face or back of neck from UV rays. UV protection includes:  
|               |   − sun block (be guided by the Cancer Council recommendations). |
| PPE for chemical application | • Employers must ensure employees follow the chemical manufacturer’s directions when working with chemicals. Refer to the relevant chemical material safety data sheet (MSDS) and product label for the correct type of PPE required.  
|               |   • If the recommended PPE interferes with the operator’s helmet or the operation of the quad bike, then an alternative vehicle should be used.  
|               |   • Equip the quad bike with a first aid kit and ensure items recommended in the MSDS are included. |
| High-visibility vest | • High-visibility vests are recommended for use, particularly when quad bikes are driven on roads. |
Case study

Obey all quad bike warning decals

Three people on a quad bike were not wearing helmets when the vehicle crashed into a fence post and overturned. The two adults were thrown clear but the quad bike overturned onto the child passenger.

The quad bike had two safety decals displaying warnings about wearing helmets and never carrying passengers.

6.6 Quad bike safety essentials

While it’s essential to plan for safety, it’s equally important to operate the quad bike according to the plan. The best farm quad bike safety plan is only as safe as the operator driving the quad bike. At a minimum, operators must:

- wear a helmet that meets Australian Standard 1698:2006 - Protective helmets for vehicle users
- wear the appropriate PPE
- undertake pre-operation checks
- only operate equipment that is correctly maintained
- operate the quad bike in accordance with the operator’s manual and farm operating rules
- work in pairs where possible.
7. Transporting and storing your quad bike

7.1  Loading (and unloading) quad bikes for transport

The following steps should be taken to load your quad bike.

1. Read the operator’s manual to identify the maximum safe slope for loading. Ramps will need to be longer the higher the tray on the transport vehicle.
2. Select a suitable site to load and unload the quad bike. Use a loading bank or platform whenever possible.
3. Box-type trailers may be lower than other options and therefore safer to use.
4. Remove loads from the quad bike. Empty spray tanks before loading.
5. If using ramps, centre the quad bike over the ramps. Select 4WD if available.
6. Check ramp carrying capacity. The weight should be marked on each ramp.
   Example: if the safe working load (SWL) for each ramp is 175kg, that’s a total load capacity of 350kg.
7. Once loaded, position the quad bike in the centre of the trailer.
8. Put the park brake on.
9. Secure the quad bike front and back with straps and harnesses in good condition.
10. Use crossover ties if you are travelling a long distance or over uneven terrain.
11. Secure other objects the quad bike is not damaged by shifting loads.

For unloading, follow the steps above, but in reverse.

7.2  Storing a quad bike

Store under cover if possible.

1. Before putting the quad bike away report any maintenance issues so they can be attended to before it is next used. Consider disabling the quad bike until repairs are completed.
2. Store any associated quad bike equipment (such as spray tanks) securely.
3. Refer to the operator’s manual if the quad bike is to be stored for a long period.
4. Remove keys to prevent unauthorised use.
8. Quad bike maintenance

A properly maintained quad bike is a safer vehicle. Regular, careful pre-operation checks and routine maintenance will keep your quad bike in reliable working condition. If you are uncertain about carrying out a maintenance task correctly, take it to a suitably qualified repairer.

Case study

Maintenance – your life may depend on it

A 56-year-old farmer and a small child were killed when a quad bike reversed and crushed them between the vehicle and a trailer. An inspection of the quad bike by a qualified technician showed that it was in a chronic state of disrepair. Only 10 per cent of the brake shoe material remained. The vehicle was judged incapable of stopping within the required distance, even at 8kph.

Like many quad bikes, this quad bike had a safety ‘lockout’ that prevents the engine being started in gear unless the footbrake is engaged, but on this one the reverse lock release cable was so rusted it had seized.

8.1 Pre-operation checks

Case study

Don't forget the pre-operation check

A farmer was checking the fuel level of his quad bike while it was in motion when he lost control of the vehicle and it rolled. He was found deceased one hour later with the bike on his chest. He was not wearing a helmet, despite one being available.

Ensure your quad bike is in proper working order before use to minimise the risk of personal injury and damage to the vehicle. It is particularly important to do a pre-operational check if you are not the person who last used the quad bike or if you have not used it for some time. This also helps avoid the possibility of getting stranded because of breakdown or lack of fuel.

The operator’s manual lists specific items to be checked before a quad bike is started up for work and is the starting point for safe operation of a quad bike. Always follow the procedures and specifications laid out in the manual.

The following sample pre-operation checklist can be adapted for use on your farm. It is also available at worksafe.vic.gov.au
Sample pre-operation checklist

Add to or adapt this checklist to suit your quad bike and place photocopies in a sturdy folder where vehicle keys and operator PPE are stored.

- Maintain completed forms to provide a record of completed inspection and/or training.
- The operator’s manual provides information about minimum maintenance activity.
- Additional copies of checklists are available at worksafe.vic.gov.au

Pre-operation checklist: For quad bike No:

☐ Check the fuel, oil and coolant every time before use with the engine off.

Visually inspect
☐ Check for damaged or loose parts. ☐ Check for fuel or oil leaks.

Wheels and Tyres
☐ Check tyres for damage. ☐ Ensure tyre pressure is correct and even in each tyre. ☐ Check wheel nuts.

Throttle
☐ Check the throttle operates smoothly across its range. Accumulated mud and dirt can restrict cable movement and prevent the throttle from closing.

Brakes
☐ Check brakes operate properly before reaching full speed.

Air filter
☐ Check it is not choked with dirt. Clean and replace regularly.

Lights and switches
☐ Check lights and switches work.

Drive chain and chassis
☐ Inspect chain for proper adjustment, wear and lubrication. ☐ Check drive shaft for oil leakage.
☐ Look and feel for loose parts with the engine off. Rough terrain will loosen chassis parts.

Steering
☐ Check the steering moves freely, but without undue looseness.

Other checks required

Maintenance actions required
For safe operation, any defects identified in a check of the quad bike must be fixed before it is put into operation. This may mean you need a suitably qualified repairer.

Done

Checked by: Date
8.2 Routine maintenance

Routine maintenance involves:

- cleaning
- inspecting
- lubricating
- adjusting
- replacing parts.

A toolkit is provided at the time of purchase and is usually stored under the seat or in a compartment on the quad bike itself.

**Maintenance tips**

Maintain your quad bike according to the maintenance schedule in the operator's manual at a minimum. Quad bike manufacturers recommend how and when routine maintenance should be conducted. The frequency of routine maintenance of your quad bike should take account of the environment in which the quad bike operates.

Ensure that a competent person carries out any maintenance tasks and a suitably qualified repairer carries out repairs.

After any significant incident or accident, have a suitably qualified service person check the vehicle and list all defects.

Wash the quad bike routinely to remove mud, manure, debris or chemical residue build up that can cause corrosion and affect operation and/or prevent controls from functioning.

Any modifications must be within the manufacturer's specifications. Changing the type of tyres or puncture-proofing tyres may adversely affect the quad bikes performance. Refer to your operator's manual and/or speak to your supplier for more details.
8.3 **Sample routine maintenance checklist**

The sample routine maintenance checklist below can be adapted for use on your farm.

- Maintain completed forms to provide a record of completed inspection and/or training.
- The operator's manual provides information about minimum maintenance activity.
- The frequency of routine maintenance of your quad bike should take account of the environment in which the quad bike operates.
- Additional copies of checklists are available at worksafe.vic.gov.au

#### Transporting quad bikes
- Do workers know how to safely load, unload, tie down and transport the quad bike?

#### Communication
- Does your farm have an established communication plan and is it followed?

#### Additional safety
- Passengers are not permitted on quad bikes.
- Children are not allowed to operate adult quad bikes.
- Are safety warnings on quad bikes obeyed?
- Is an appropriate first aid kit carried and maintained?
- Is unauthorised use of the quad bike controlled by the removal of keys?

#### Additional requirements for farm:

### Sample checklists

The sample checklists for quad bikes that appear in this handbook are available online for adaptation to particular properties and particular quad bike models. Farmers can add to or alter each form to suit their property and copy the customised form as needed.

Completed forms can provide a record of completed inspection and/or training.

The sample checklists available at worksafe.vic.gov.au are:
- Quad bike operator skills assessment
- Pre-operation checklist
- Routine maintenance checklist
- Safe quad bike operation.
